

Writing Code Together

When you come in, line up from the front of the room to the back of the room in order of height - shortest in the front of the room, tallest in the back.

If you are in your third or fourth year of programming, do the same in a different line.

Question of the day (and roll).

Rules:

3rd and 4th year students may not code, but may help by giving suggestions or helping the group move along

Write the code by hand.

In your groups (with an advanced student leader), write and debug code

You are in charge of chartering busses for tour groups. You need to make sure that each bus is filled to capacity before you hire vans. Each bus holds 60 people. Get the number of people going on the tour from the user and then output the number of busses and the number of people left over who will need to ride in vans. (Use modulus to your best advantage.) As an extension, calculate the number of vans if the vans can take 7 people. Give an introduction and ask for the user's name (put it in a String). Make sure to address the user when you ask for the input. Get the appropriate input from the user. Make sure to address the user when you come up with the answer and label the output appropriately.

Notes: Concentrate on the calculations, not the input and output. Use the clear boards and white board markers.
