

Reading Code Together

When you come in, line up from the front of the room to the back of the room in alphabetical order of according to your first name. A in the front of the room, Z in the back.

Question of the day (and roll).

In groups of 2 or 3, read and fix (debug) code

```
Console.WriteLine("This is a quick warmup)
```

```
double z = 3.0;
```

```
switch (z)
```

```
{
```

```
    case 1.0:
```

```
        ...
```

```
        break;
```

```
    default:
```

```
        ...
```

```
        break;
```

```
}
```

Can you fix // these lines above?

```
// what does the following code do?
```

```
int a = -1;
```

```
if(a < 0) Console.WriteLine("Negative.");
```

```
else if (0 < a) Console.WriteLine("Positive.");
```

```
else Console.WriteLine("Zero.");
```

In groups of 2 or 3, read and fix (debug) code

Create some lines of code like the previous page. These lines of code must demonstrate if and switch. Some lines are for debugging and fixing. Other lines are for reading and understanding what the code will do.

Exchange your code with another group to see how you each do on the other group's code segments.
